

## Requirements and background knowledge:

- git document:
  - o For studious guy:
    - <https://git-scm.com/doc>
    - <https://www.atlassian.com/git/tutorials/>
  - o For lazy guy like me: <http://rogerudler.github.io/git-guide/>
  - o For guy who love playing game - (like me again): <https://try.github.io>
- download and install git: <https://git-scm.com/download>

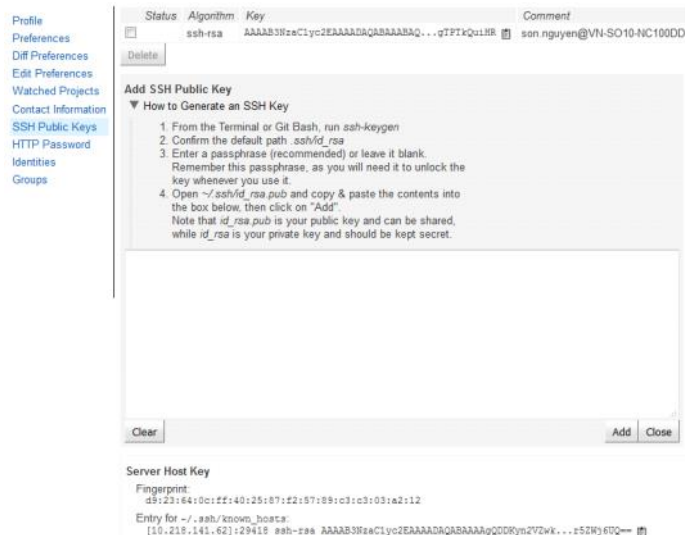

## Optional:

- <https://tortoisegit.org/> very useful git with GUI
- create a personal account and repository on github.com and play around (do it at home, don't push company code to github :))

1. Login into gerrit webpage:
  - a. <http://10.218.141.62:8080>
  - b. Choose: trainer\_1@example.com account (listed after login textboxes)
2. Go to setting page:

3. In SSH Public Keys tab, follow Add SSH Public Key guide to add new SSH key

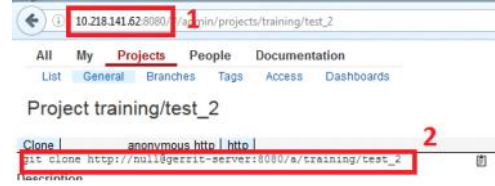

Note that you can add multiple SSH key into the same account, each computer should have only one identical SSH key, do not remove other keys unless you are the owner of this key.

4. Back to the main page, in Projects/List menu, you would see a list of available project ( ~ git repository)

5. Choose training/test\_1 project (I accidentally cropped the next images from test\_2, please notice the differences)

5. Clone this repository into your local directory, in this case I use http:

In the git bash command prompt, copy the http git clone command and edit:

```
null -> trainer_1
gerrit-server -> IP of gerrit server (box 1)
```

In case a login box appears like this, don't close, process the next step

7. Back to gerrit User setting page, HTTP Password tab, you would see

## Settings

Copy the Username and Password into Windows Security Prompt windows.

8. Clone successful message:

**Note:** The step 3 is necessary if you pull and push the code using SSH, gerrit and your local git will verify your computer using this SSH key.

9. Now make some changes in your local repository.
  - a. In the test\_1 folder (in your computer directory), you would see a test.cpp file, this file is cloned from the training/test\_1 repository.
  - b. Make some changes on this file using any text editor.
  - c. Open command prompt from this directory and type: **git status**:

```
D:\git\test_1>git status
On branch master
Your branch is up-to-date with 'origin/master'.
Changes not staged for commit:
  (use "git add <file>..." to update what will be committed)
  (use "git checkout -- <file>..." to discard changes in working directory)

        modified:   test.cpp

no changes added to commit (use "git add" and/or "git commit -a")
D:\git\test_1>
```

12. Now back to gerrit, happy to find the All/Open tab:

See your commit? yes, exactly your commit. The most recent commit will be on top.

```
changes not staged for commit:
(use "git add <file>..." to update what will be committed)
(use "git checkout --<file>..." to discard changes in working directory)

modified:   test.cpp

no changes added to commit (use "git add" and/or "git commit -a")
D:\git\test_1>
```

- This means that you have modification(s) on your local branch and have not committed the change(s)
- Add the change to the commit: **git add \***
  - Notice that \* means you will add all the file| changes|modification into commit ready state, you can choose single file or specific files with commands like:
    - git add \*.txt
    - git add myNewFile.h

```
f. git status again
D:\git\test_1>git status
On branch master
Your branch is up-to-date with 'origin/master'.
Changes to be committed:
  (use "git reset HEAD <file>..." to unstage)

    modified:   test.cpp

D:\git\test_1>
```

- Now commit the code:
  - git commit -m "My first commit"** with -m means your commit message
  - Now your modification(s) are safe (maybe) on your local repository

```
Want to see the change: git log
D:\git\test_1>git log
commit 494d7973112e8925cf945d14b44d74f94dd10
Author: SON DANG NGUYEN/LGEUH UC IUI SOFTWARE DEVELOPMENT 1(son.nguyen@lge.com)
Date: Tue Jul 12 15:41:22 2016 +0700

    My first commit

commit 2c987566843bec3219d583fed6a2ed9e5b221d2a
Author: gerrit-server <admin@example.com>
Date: Tue Jul 12 10:23:15 2016 +0700

    First commit

D:\git\test_1>
```

- Push to Gerrit
  - Now back to Gerrit webpage, on Projects, choose **training/test\_1** project, move to **Branches** tab. (Try to find it yourself, honestly after 2 years of pushing my dumb code to Gerrit I still unable to understand the logical of those menus and tabs, rofl)

- Create new branch with your own branch name, initial revision is "master" (you are right, it is exactly the master branch showed in the Branch Name list above).
- Now push your local changes into Gerrit:  
**git push origin HEAD:refs/for/master\_sonnd** <- see the logic? Yeah, not too hard.

```
D:\git\test_1>git push origin HEAD:refs/for/master_sonnd
Counting objects: 3, done.
Writing objects: 100% (3/3), 320 bytes | 0 bytes/s, done.
Total 3 (delta 0), reused 0 (delta 0)
remote: Processing changes: refs: 1, done
remote: ERROR: missing Change-Id in commit message footer
remote: Hint: To automatically insert Change-Id, install the hook:
remote: gitdir=$(git rev-parse --git-dir); scp -p -P 29418 trainer_1@gerrit-se
ver:/hooks/commit-msg $(gitdir)/hooks/
remote: And then amend the commit:
remote: git commit --amend
remote: To http://trainer_1@10.218.141.62:8080/a/training/test_1
! [remote rejected] HEAD -> refs/for/master_sonnd (missing Change-Id in commit
message footer)
error: failed to push some refs to 'http://trainer_1@10.218.141.62:8080/a/train
ing/test_1'
D:\git\test_1>
```

See the error? Congratulations, you are on track, follow the Hint on the error message and commit again. Believe me, you don't have to research the reason that causes the error, just follow the Hint. (ah, yes, replace **gerrit-server** with gerrit server address, and remember to use **git bash** )

- Now, back to the part c, look at the code, you will ask why **origin**? Ok, type **git remote -v**, it shows that **origin** is just the name of the remote repository, you can actually change it to whatever you want.
- What is **HEAD:refs/for/master\_sonnd**? I don't know the story behind, but next section I will show you why you need this.

```
D:\git\test_1>git push origin HEAD:refs/for/master
Counting objects: 3, done.
Writing objects: 100% (3/3), 359 bytes | 0 bytes/s, done.
Total 3 (delta 0), reused 0 (delta 0)
remote: Processing changes: new: 1, refs: 1, done
remote: New Changes:
remote: http://gerrit-server:8080/33 My first commit
remote: To http://admin@10.218.141.62:8080/a/training/test_1
= [new branch] HEAD -> refs/for/master
D:\git\test_1>
```

Now you successfully pushed your modification into Gerrit.

# Follow the Hint, and It works

☆ My first commit	trainer_1	training/test_1
☆ Second commit	Admin	training/test_1

See your commit? yes, exactly your commit. The most recent commit will be on top.

- Take a look at Code review page by click on the commit. Check the file, it will show you what you had changed. You can even comment on it.

- Oh, loooooo! I made it wrong! The second line should be a readable text. What should I do? Don't worry (until you tell the leader or sub-leader come here and review your code, lol they will ask you much)
- Now go back to your local repo, imagine the git branches and commits just like a linked-list. You go one wrong step, remove it, go back and take another step.

- Git log to see where you are

```
D:\git\test_1>git log
commit a6bd86a41c72e5508c4d3f3340ba87f0f9461226
Author: SON DANG NGUYEN/LGEUH UC IUI SOFTWARE DEVELOPMENT 1(son.nguyen@lge.com)
Date: Tue Jul 12 15:41:22 2016 +0700

    My first commit

Change-Id: Ic19165dc7bbca4eca42dae6541f5e2a5986b9935

commit 2c987566843bec3219d583fed6a2ed9e5b221d2a
Author: gerrit-server <admin@example.com>
Date: Tue Jul 12 10:23:15 2016 +0700

    First commit

D:\git\test_1>
```

- Go back 1 commit: **git reset HEAD~1**
- Edit file (9.b)
- Add the changes (9.c)
- Commit it again
- Now wait, the push command changed. Remember the last command? (**git push origin HEAD:refs/for/master\_sonnd**) Now you have to update the change you already committed, how to do that?  
**git push origin HEAD:refs/changes/33**
- Yes, you should ask where the number **33** came from?  
Remember the Code Review page?

See the number 33?  
Again, back to the 11.e, see the magic number? Nice!

Then we almost done the basic.

This part I will show you some commands related to git that I usually use:

- git add
- git status
- git clone
- git fetch
- git push
- git commit
- git reset --h
- git clean -dfx
- google (lol)

## IN CASE OF FIRE

- ♦ GIT COMMIT
- ♦ GIT PUSH
- 🚪 LEAVE BUILDING

**Follow the Hint,  
and It works**

# Install and setting gerrit system

Version: 0.1 (not official)  
Author: son.nguyen

Thursday, July 07, 2016 9:40 AM

## Requirement:

- Linux Ubuntu
- Java

## References:

<https://www.digitalocean.com/community/tutorials/how-to-install-gerrit-on-an-ubuntu-cloud-server>  
<https://gerrit-review.googlesource.com/Documentation/install-quick.html>  
<https://www.digitalocean.com/community/tutorials/how-to-install-java-on-ubuntu-with-apt-get>

## Maintenance:

- Restart: `~/gerrit/bin/gerrit.sh restart`
- Stop: `~/gerrit/bin/gerrit.sh stop`
- Start: `~/gerrit/bin/gerrit.sh start`

## 4. SSH check existing:

- Check whether there are any ssh keys already. You're looking for two files, `id_rsa` and `id_rsa.pub`:

```
user@host:~$ ls .ssh
authorized_keys config id_rsa id_rsa.pub known_hosts
```

- If you have the files, you may skip the key generating step.
- If you don't see the files in your listing, you will have to generate rsa keys for your ssh sessions:

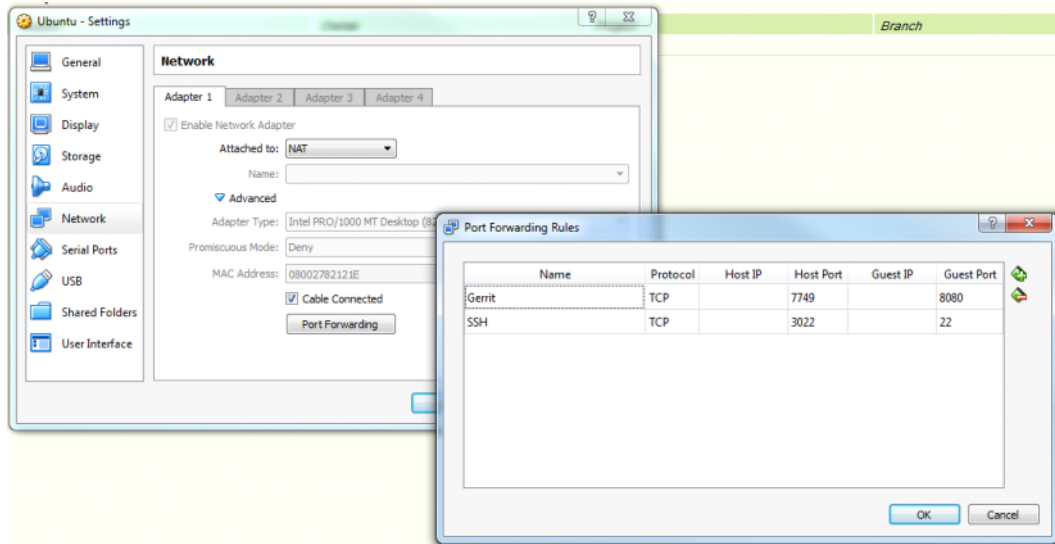

## 5. Generate SSH key:

**Please don't generate new keys if you already have a valid keypair! They will be overwritten!**

- `ssh-keygen`  
Note that the `ssh-keygen` will ask multiple times for passphrase, set null by press enter for default. Normally you will not need the passphrase.

## 6. NAT VirtualMachine Ethernet port

- This step allows you access gerrit from outside the virtual machine

- On Network setting tabs, create new port forwarding like the "Gerrit" one in the figure. Note that you can set the Host Port whatever you like.

## 7. Access gerrit from your machine:

- <http://127.0.0.1:7749> (or whatever port you set)

## 1. Install packages:

- `sudo apt-get update`
- `sudo apt-get install default-jre git`

## 2. Get source:

- Create gerrit user and become the user:

- o `sudo adduser gerrit`
- o `sudo su gerrit`

## - Download gerrit:

- o `cd` to user home and `mkdir` a folder to save gerrit source: `mkdir ~/gerrit_source`, `cd` to `gerrit_source` folder.java
- o Download gerrit, check out the last stable or recommended version:
  - `wget https://www.gerritcodereview.com/download/gerrit-2.12.3.war`

```
gerrit@sonnd-VirtualBox:~/gerrit_source$ wget https://www.gerritcodereview.com/download/gerrit-2.12.2.war
--2016-07-07 09:46:47-- https://www.gerritcodereview.com/download/gerrit-2.12.2.war
Resolving www.gerritcodereview.com (www.gerritcodereview.com)... 216.58.199.110, 2404:6800:4005:803::200e
Connecting to www.gerritcodereview.com (www.gerritcodereview.com)[216.58.199.110]:443... connected.
HTTP request sent, awaiting response... 302 Moved Temporarily
location: https://gerrit-releases.storage.googleapis.com/gerrit-2.12.2.war [following]
--2016-07-07 09:46:48-- https://gerrit-releases.storage.googleapis.com/gerrit-2.12.2.war
Resolving gerrit-releases.storage.googleapis.com (gerrit-releases.storage.googleapis.com)... 216.58.199.112, 2404:6800:4005:803::2010

HTTP request sent, awaiting response... 200 OK
length: 27146885 (26M) [application/octet-stream]
Saving to: 'gerrit-2.12.2.war'

100%[=====] 27146885 469 KB/s

2016-07-07 09:47:46 (469 KB/s) - 'gerrit-2.12.2.war' saved [27146885/27146885]

gerrit@sonnd-VirtualBox:~/gerrit_source$ ls
gerrit-2.12.2.war
```

## 3. Initialize the site:

- check out the name of .war file
- `java -jar gerrit-2.12.2.war init --batch -d ~/gerrit`

```
gerrit@sonnd-VirtualBox:~/gerrit_source$ ls
gerrit-2.12.2.war
gerrit@sonnd-VirtualBox:~/gerrit_source$ java -jar gerrit-2.12.2.war init --batch -d ~/gerrit
Generating SSH host key ... rsa(simple)... done
Initialized /home/gerrit/gerrit
Executing /home/gerrit/gerrit/bin/gerrit.sh start
Starting Gerrit Code Review: OK
gerrit@sonnd-VirtualBox:~/gerrit_source$
```

- When the init is complete, you can review your settings in the file '`$site_path/etc/gerrit.config`' and exit gerrit user by 'exit'

#### - Create new project from scratch:

If you choose to create a new repository from scratch, it's easier for you to create a project with an initial commit in it. That way first time setup between client and server is easier.

This is done via the SSH port:

```
user@host:~$ ssh -p 29418 user@localhost gerrit create-project test_project --empty-commit
user@host:~$
```

Or you can use gerrit web:

This will create a repository that you can clone to work with.

Note: If you create project from scratch, **"My first change"** is your next step.

#### - My first change

Download a local clone of the repository and move into it

```
user@host:~$ git clone ssh://user@localhost:29418/demo-project
Cloning into demo-project...
remote: Counting objects: 2, done
remote: Finding sources: 100% (2/2)
remote: Total 2 (delta 0), reused 0 (delta 0)
user@host:~$ cd demo-project
user@host:~/demo-project$
```

Then make a change to it and upload it as a reviewable change in Gerrit.

```
user@host:~/demo-project$ date > testfile.txt
user@host:~/demo-project$ git add testfile.txt
user@host:~/demo-project$ git commit -m "My pretty test commit"
[master ff643a5] My pretty test commit
1 files changed, 1 insertions(+), 0 deletions(-)
create mode 100644 testfile.txt
user@host:~/demo-project$
```

Usually when you push to a remote git, you push to the reference '/refs/heads/branch', but when working with Gerrit you have to push to a virtual branch representing "code review before submission to branch". This virtual name space is known as /refs/for/<branch>

```
user@host:~/demo-project$ git push origin HEAD:refs/for/master
Counting objects: 4, done.
Writing objects: 100% (3/3), 293 bytes, done.
Total 3 (delta 0), reused 0 (delta 0)
remote:
remote: New Changes:
remote: http://localhost:8080/1
remote:
To ssh://user@localhost:29418/demo-project
 * [new branch] HEAD -> refs/for/master
user@host:~/demo-project$
```

You should now be able to access your change by browsing to the http URL suggested above, <http://localhost:8080/1>

#### - Already existing project on your local

The other alternative is if you already have a git project that you want to try out Gerrit on. First you have to create the project. This is done via the SSH port:

```
user@host:~$ ssh -p 29418 user@localhost gerrit create-project demo-project
user@host:~$
```

You need to make sure that at least initially your account is granted "Create Reference" privileges for the refs/heads/\* reference. This is done via the web interface in the Admin/Projects/Access page that correspond to your project.

After that it's time to upload the previous history to the server:

```
user@host:~/my-project$ git push ssh://user@localhost:29418/demo-project *: *
Counting objects: 2011, done.
Writing objects: 100% (2011/2011), 456293 bytes, done.
Total 2011 (delta 0), reused 0 (delta 0)
To ssh://user@localhost:29418/demo-project
 * [new branch] master -> master
user@host:~/my-project$
```

This will create a repository that you can clone to work with.
